2.3B Overseas Support – Comparable Contract Evidence

Tender Question: Provide evidence that the Bidder can continually and consistently meet contracted lead times and deliver the overseas service provision throughout the life of the contract.

Scoring Focus: One contract within the last two years comparable in size, scope and type, highlighting achieved overseas performance.

COMPARABLE EVIDENCE BASE: Pulse Fitness's recent MOD overseas activity demonstrates location-based engineering, direct UK deployment, mixed-brand diagnosis and repair, planned service, parts follow-on and high-frequency preventative maintenance. All quantified evidence uses the aligned period 1 August 2024 to 31 July 2026.

6	113	136	249
territories evidenced	case-managed requirements	Nepal PPM reports	records reviewed

Broader evidence rather than isolated success stories

The submission deliberately uses the full recent evidence base instead of selecting three favourable jobs. Response statistics are calculated from 113 case-managed requirements with a populated response value across Cyprus, the Falkland Islands, Brunei, Gibraltar and Kenya. Nepal is presented separately because its evidence consists of frequent planned maintenance reports rather than reactive call timestamps.

The combined recorded average is 3.33 days and the median is four days. Within the case-managed population, 49.6% of responses were recorded within three days, 90.3% within four days, 98.2% within five days and every recorded response within six days. These are described as recorded response days because the historic source field does not independently define every contractual clock start, stop and exclusion rule.

The five territories represent materially different delivery conditions: established local routes, a remote South Atlantic location and direct UK deployment where a resident route is not used. The fact that the performance is presented by territory—rather than hidden within one blended claim—allows the evaluator to see the real operating context.

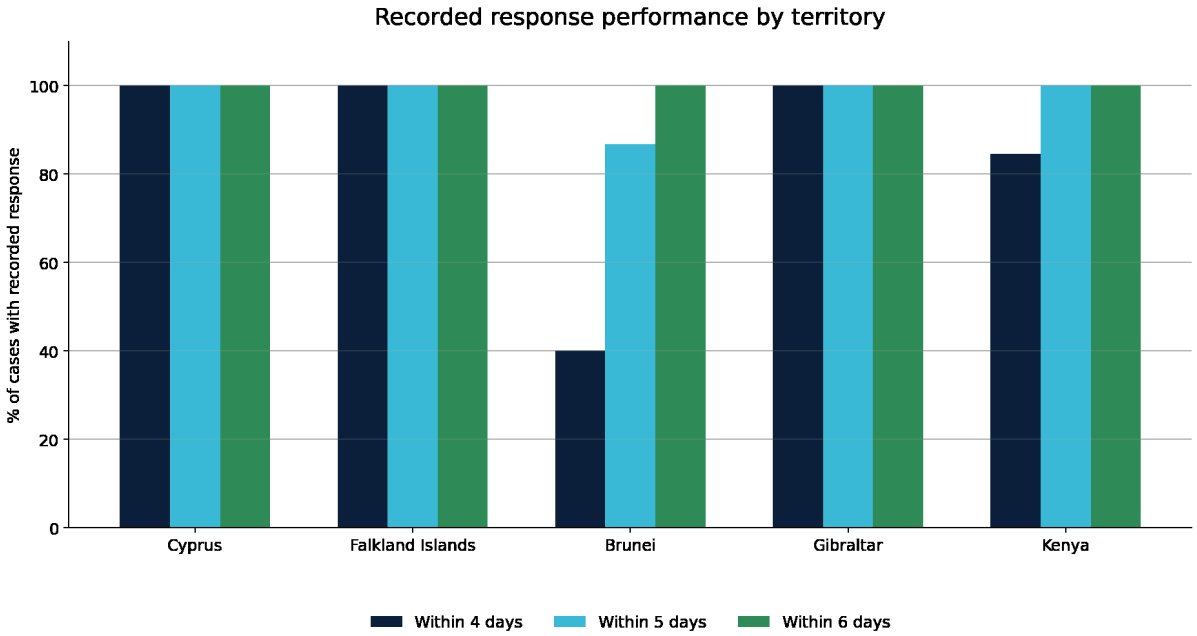

Figure 1 – Recorded overseas response performance by territory.

What the figure shows: *The chart compares the proportion of cases within four, five and six days for Cyprus, the Falkland Islands, Brunei, Gibraltar and Kenya.*

Why it matters to the MOD: *The figure demonstrates consistent delivery across different support routes. It also shows the effect of direct deployment in Brunei without disguising that difference inside a single unsupported SLA claim.*

Territory	Cases	Average	Median	Recorded threshold position
Cyprus	30	3.27 days	3 days	100% within four days
Falkland Islands	41	3.17 days	4 days	100% within four days
Brunei	15	4.20 days	5 days	40% within four; 100% within six days
Gibraltar	14	2.86 days	3 days	100% within four days
Kenya	13	3.46 days	3 days	84.6% within four; 100% within five days

The work completed overseas

The records show much more than attendance. They demonstrate the practical work carried out by location-based and directly deployed engineers across planned inspection, diagnosis, mechanical and electronic repair, assembly, component replacement and controlled follow-on. One requirement can include several work themes, so the categories overlap rather than being forced into a single label.

Mechanical repair and adjustment appears in 68 case records and includes bearings, cables, pulleys, pedals, cranks, ropes, fasteners, alignment, calibration and lubrication. Bike,

rower and functional-equipment activity appears in 62 records, while parts replacement or controlled follow-on appears in 60. Treadmill and drive-system work appears in 42 records. Electronic, console and sensor diagnosis appears in 37 records, and the same number contain diagnosis, condition, safety or advisory activity.

This breakdown demonstrates that Pulse Fitness is not relying on overseas partners solely for simple visual inspections. The evidence includes technical diagnosis, major component identification, mixed-brand repairs and the control of work that cannot safely be completed on the initial attendance.

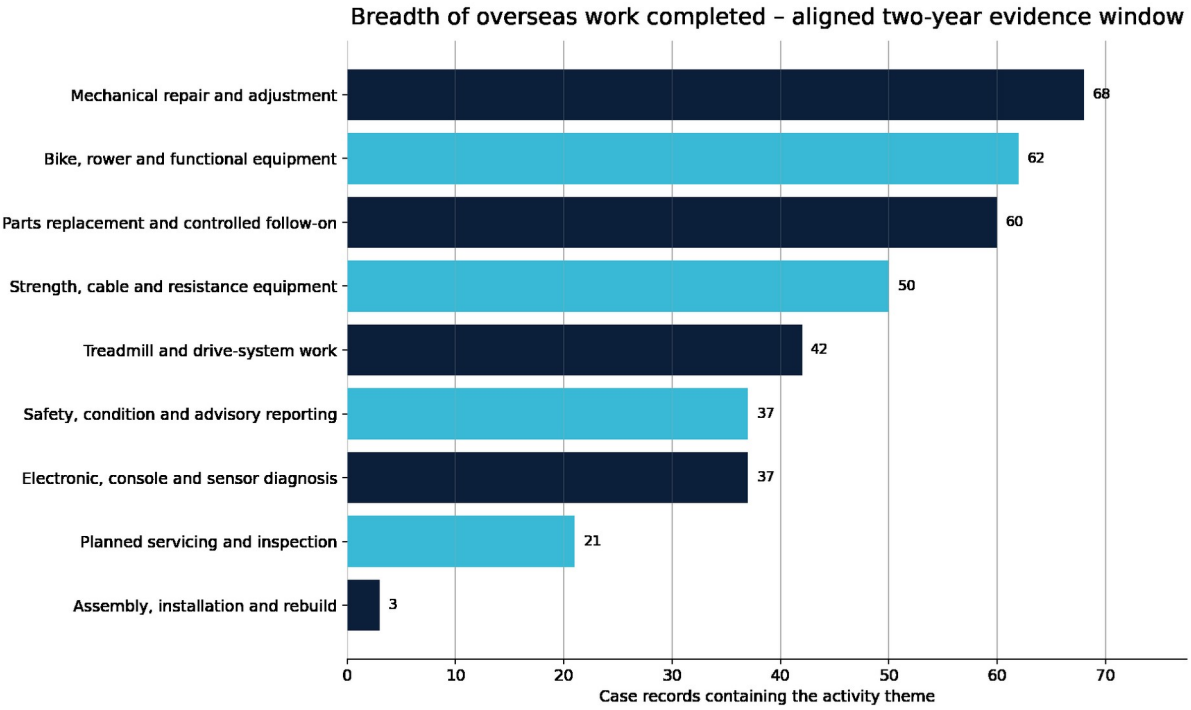

Figure 2 – Breadth of overseas work completed.

What the figure shows: *The chart counts case records containing each work theme, including mechanical repair, bikes and rowers, parts follow-on, strength and cable work, treadmills, servicing, electronic diagnosis and assembly.*

Why it matters to the MOD: *The breadth shows the practical competence required to maintain a live overseas estate. It also supports the proposed combination of local engineering, Congleton technical support and central parts control.*

Mixed-equipment capability

The evidence covers cardiovascular, functional and strength equipment from Pulse Fitness and major third-party manufacturers. Recorded work includes treadmills and runners, Wattbikes and other cycles, Concept2 rowers and SkiErgs, selectorised and plate-loaded strength equipment, cable stations, consoles, displays, sensors and smaller functional-training components.

This is directly relevant to the MOD estate. Overseas facilities are not single-manufacturer environments, and the most effective engineer must work from the installed equipment and actual fault rather than a restricted product catalogue. Pulse Fitness's training, technical escalation and parts model has been built around that reality.

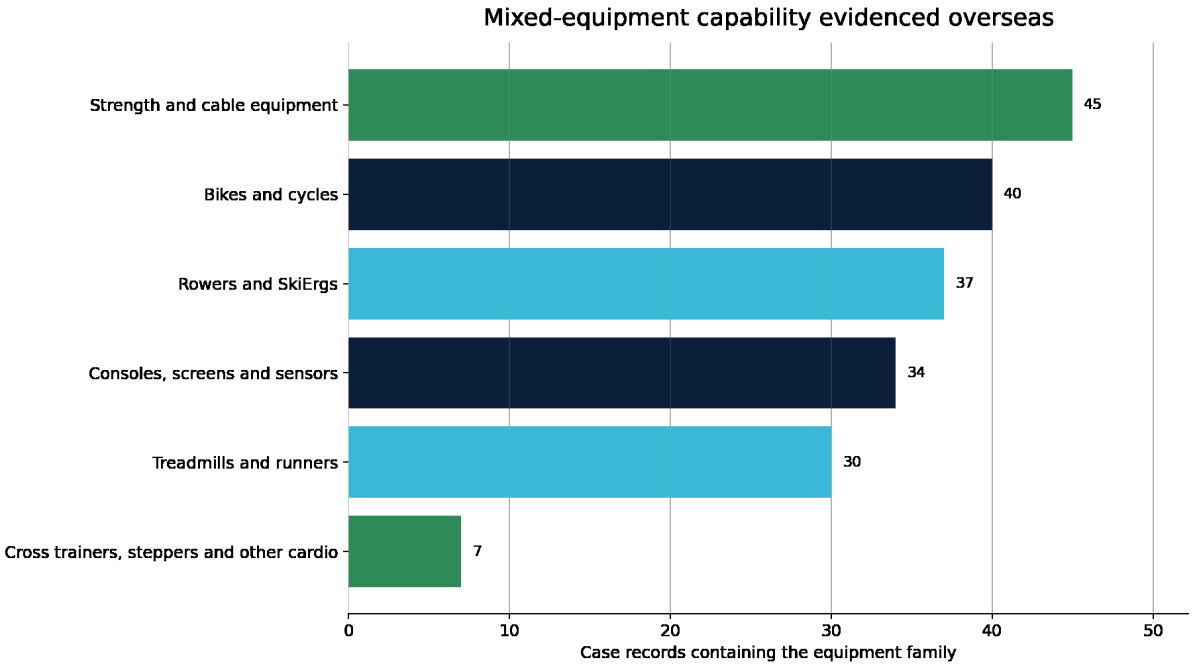

Figure 3 – Mixed-equipment capability evidenced overseas.

What the figure shows: *The chart shows the number of case records containing strength/cable equipment, bikes and cycles, rowers and SkiErgs, consoles and sensors, treadmills and runners and smaller functional items.*

Why it matters to the MOD: *The distribution demonstrates capability across the full gym environment and supports the Authority's need for one service route covering Pulse and third-party equipment.*

Territory context

Cyprus provides an established location-based route across planned service and mixed-brand repair, with every recorded response in the aligned period within four days. Gibraltar demonstrates named resident continuity across planned Type A and reactive work, also with every recorded response within four days. Kenya provides a consistent BATUK route across planned service, diagnosis and repair, with all recorded responses within five days.

The Falkland Islands demonstrate sustained local support in a remote environment where practical continuity and parts follow-on are essential. Every populated recorded response in the aligned period falls within four days. Brunei demonstrates the direct-deployment model and controlled major-component follow-on; all recorded responses fall within six days. These differences support the route-selection process proposed in the delivery plan.

Nepal – frequent preventative maintenance and no separate breakdown call-outs

136	1,964+	~Weekly	99.3%
planned-maintenance visits	asset-level actions recorded	attendance cadence (7-day median)	assets recorded Good

The Nepal evidence covers British Gurkhas Nepal facilities at Kathmandu/Manbhawan and Pokhara from December 2024 to May 2026. It records frequent local preventative

maintenance, including inspection, operational testing, adjustment, cleaning, lubrication, safety verification and electrical or resistance checks across the estate. The programme is evidenced by more than 130 dated job sheets covering both British Gurkha camps — Kathmandu (Manbhawan) and Pokhara — on an approximately weekly cycle, each recording the machines attended, the checks completed and the next scheduled maintenance date.

No separate reactive breakdown call-outs were identified in the supplied Nepal evidence. The correct interpretation is not that maintenance was unnecessary; it is that approximately weekly attendance allowed emerging issues to be identified and managed during planned visits before they developed into a wider pattern of breakdowns. Of the quantified asset actions, 99.3% were recorded Good.

The two replacement-required entries related to the same treadmill rear roller cap. Subsequent records returned the asset to Good condition. Nepal is therefore used as evidence of sustained proactive maintenance and equipment availability, not as a reactive response KPI.

WHY THE EVIDENCE IS COMPARABLE: The aligned two-year records show six territories, three distinct support models, a broad mixed-equipment workload, controlled parts follow-on and a high-frequency preventative-maintenance route. They demonstrate that Pulse Fitness can sustain overseas support under one central commercial, technical and evidence structure.

How the evidence strengthens the proposed contract

The overseas history has shaped the final plan. Local continuity in Cyprus, Gibraltar, Kenya and the Falkland Islands supports the vetted dealer-network approach. Brunei supports direct UK deployment where local capability is not the right answer. Nepal demonstrates the value of regular planned attendance. The work-type and equipment breakdown supports the investment in remote triage, Congleton technical support, parts planning and a full overseas MODService record.

Pulse Fitness is not asking the evaluator to infer global capability from a map. The recent records show actual service, repair and maintenance activity across multiple territories and delivery routes, with transparent response reporting and clear evidence of the work undertaken. That experience provides a lower-risk foundation for the full global reach required by LSL/DC/0223.
