Pulse Fitness AI x Sicon - Meeting Checklist

Date: June 2026 | Prepared by: Pulse Fitness AI (pulsefitness.ai)

Purpose: confirm the open technical + data questions to complete an automated, scalable migration (approx. 5,000 customers / 300,000 equipment).

Status at a glance

Domain	Read/List API today?	Status
Customers / contacts	Yes (Sage Core + Sicon CRM, paged, delta)	Ready to automate
Service cases / appts / notes	Yes (live, push + poll)	Built
Contracts	Push-only (no GET)	Interim CSV - needs read API
Equipment (300k)	No list endpoint	BLOCKED - primary ask

Specs re-verified June 2026 - all 5 unchanged (Service R260200c, CRM R221200c, Contracts R260200c, CoreWebAPI R260200c, Projects R260200c). Auth: HTTP Basic over TLS + companyId per call.

A. Routing / API-shape (from our client integration)

- A1 - Appointment routes. Our client targets /~/api/v2/TEntity/api/Service/Appointments (create/get/update) and /~/api/v2/TEntity/{id} (delete). Confirm this /~/api/v2/TEntity/ prefix is the real production route (and that ~ resolves to the WebAPI site root).
- A2 - Appointments by case. No case-scoped appointment list exists in the spec. How should we poll all appointments for a given SiSMCaseID?
- A3 - Priorities lookup. The Service spec exposes no priorities endpoint. Is a priorities list available anywhere, or do we hard-map PriorityID via config only?

B. Equipment - highest priority (300k assets)

- B1 - List/search API. Any endpoint to list/search the installed Equipment / Service Asset register per company - ideally paged with a 'changed since' filter for delta sync?
- B2 - Generic reader. If not dedicated, can Equipment be read via GET /~/api/v2/TEntity? If so, what is the entity type/identifier for Equipment and which fields are returned?
- B3 - Export fallback. If no API exists, a one-time SQL/CSV export per company with: SiconEquipmentID, serial, make/model/type, install date, warranty/contract cover, linked customer (SLCustomerAccountID), site/sub-location. Our importer is ready.

C. Contracts

- C1 - Read endpoint. Is a GET/list endpoint for Service Contracts + contract lines available or planned (migrate existing contracts + read state back)? If not, a CSV/DB export?
- C2 - Coverage linkage. How is the link between an equipment asset, its site/sub-location, and its covering contract exposed for reading?

D. Operational

- D1 - Limits. Recommended rate limits / page sizes for bulk reads at scale (5k customers / 300k assets)?
- D2 - Change feed. Any webhooks / change notifications, or is scheduled polling (AmendedAfterDate / updated-since) the expected pattern?
- D3 - Endpoints. Confirm the production base URL pattern per customer instance and any IP allow-listing needs.

Our asks / next steps

- Unblock Equipment (B1-B3) - the largest domain and main migration blocker.
- Confirm contract read path (C1) so we can drop the CSV interim.
- Confirm routing (A1-A3) so our built integration validates against a live instance.
- On receipt of Base URL + WebAPI username/password + companyId, we run a live connection test (Ping) same day.
