Pulse Fitness AI × Sicon / Sage 200 — Integration Brief

Prepared for: Sicon Integration / Partner Team

Prepared by: Pulse Fitness AI (pulsefitness.ai)

Date: 29 June 2026

Status: For review — confirmation requested on the open items in Section 6

1. Executive Summary

Pulse Fitness AI is onboarding our customer base onto the platform and needs to migrate and then continuously synchronise three data domains from Sicon / Sage 200: Customers, Equipment (installed, serial-numbered assets) and Service Contracts.

Scale: approximately 5,000 customers and 300,000 pieces of equipment.

We have reviewed six published Sicon/Sage WebAPI specifications (Section 2). Our connection and authentication layer is built and tested against the documented Basic-auth + companyId model.

Headline finding: two of the three domains are achievable today with the published APIs, but one critical capability is missing from every published specification we hold — there is no published endpoint to list/read the installed Equipment register (serial-numbered service assets). This is our largest data domain (300k records) and the primary blocker to a fully automated migration. Section 6 lists the specific questions we need Sicon to answer.

Domain	Volume	Read/List API available?	Verdict
Customers	~5,000	Yes (Sage Core + Sicon CRM)	Ready to automate
Contracts	per customer	No (push-only API)	Manual/export interim; needs read API
Equipment	~300,000	No list endpoint found	BLOCKED — Sicon input required

2. APIs Reviewed

Specification	Scope	Relevance
Service.R260200c	Service Mgmt — cases, appointments, notes, resources	Operational case sync; equipment only embedded on cases
Contracts.R260200c	Service Contracts	Push-only (4x POST, no GET)
CRM.R221200c	Sicon CRM — companies, people, opportunities	Customer/contact read (paged)
CoreWebAPI.R260200c	Sage 200 Core — customers, suppliers, stock, ledgers	Customer master read (incremental)
Projects.R260200c	Sicon Project / Job Costing (SIJC)	Jobs/labour/budgets — no equipment
Sicon WebAPI Auth Guide	Basic auth + companyId	Connection model confirmed

3. Connection & Authentication (confirmed)

- Method: HTTP Basic over TLS — Authorization: Basic base64(username:password) (ISO-8859-1).
- Company scoping: companyId query parameter on every request.
- Credential source (per company): Sage 200 client -> Sicon WebAPI -> Maintain WebAPI Users; companyId from Sage System Administration.

- Pulse Fitness storage: credentials Fernet-encrypted at rest, per-organisation, never exposed to the browser; all calls server-to-server.

What we need from each customer at go-live: Base URL, WebAPI username/password, Sage companyId.

4. Entity Mapping

4.1 Customers — READY

Source of truth: Sage 200 (customer account); enriched by Sicon CRM.

Pulse Fitness field	Sicon/Sage field	Source API	Direction
company_name	Customer Account Name / Name	Core GET /api/Customer/GetCustomers	Sage -> Pulse
sage_customer_id	SLCustomerAccountID	Core / CRM Companies/SL/{id}	Sage -> Pulse
sage_customer_reference	Customer Reference	Core GetCustomers?Reference=	Sage -> Pulse
sicon_company_id	SiconCRMCompanyID	CRM GET /api/CRM/Companies	Sicon -> Pulse
address / postcode / phone	Customer + delivery addresses	Core CustomerDeliveryAddress, CRM Addresses	Sage -> Pulse
contacts (people)	Customer Contacts / CRM People	Core Customers/Contacts, CRM GET /api/CRM/People	Sage/Sicon -> Pulse
VAT / currency / terms / credit / status	Customer financial fields	Core Customer	Sage -> Pulse

Incremental sync: Core GetCustomers supports AmendedAfterDate (delta pulls). CRM list endpoints support page / pageSize pagination. Both scale to 5,000 cleanly.

4.2 Equipment — BLOCKED (no read/list API found)

Pulse Fitness field	Expected Sicon field	Status
sicon_equipment_id	SiconEquipmentID	In Service spec but only embedded on a Case (Equipments[])
serial_number	(equipment identifier)	No list/search endpoint
sage_item_id	ItemID (stock link)	Stock catalogue only (SKU, not installed asset)
machine_type / make / model	Equipment Name / item attributes	No standalone read
install / warranty / contract cover	—	No standalone read

Problem: across Service, CRM, Core and Projects there is no endpoint that lists or searches installed equipment. Service exposes Equipment only as a child array on a Service Case; Core StockItem is the product/SKU catalogue (traceable serial/batch stock, but not the installed service-asset register). We cannot enumerate 300k assets from any documented route. See Section 6, Q1-Q3.

4.3 Service Contracts — PARTIAL (push-only; no read)

Pulse Fitness field	Sicon field	API	Direction
contract_number	SiconContractNumber	POST /api/Contract/CreateUpdateContract	Pulse -> Sicon
sicon_contract_id	SiconContractID	(creation response)	Sicon -> Pulse
customer link	CustomerNumber / SLCustomerAccountID	Contract POST	Pulse -> Sicon
customer_order_number	—	POST UpdateContractCustomerOrderNumber	Pulse -> Sicon
contract lines	—	POST /api/ContractLine/PostContractLine	Pulse -> Sicon
start / end / value / SLA	Contract fields	Contract POST	Pulse -> Sicon

Problem: Contracts.R260200c contains only POST endpoints — no GET/list/read of existing contracts or lines. We can write contracts into Sicon but cannot pull a customer's existing contract book out for migration, nor read contract state back for two-way sync. See Section 6, Q4.

4.4 Service Cases / Appointments / Notes — already built

Pulse Fitness	Sicon	API
Issue (fault)	Service Case	POST /api/service/cases; GET /api/service/cases (list)
Case status / engineer / teams	Case fields	GET /api/service/cases/{id} (poll)
Appointments / time bookings	Appointments	Service/Appointments, .../TimeBookings
Timeline notes	Tracking Notes	Service/Cases/{caseID}/TrackingNotes (bi-directional)
Engineers	Appointment Resources / SIJCEMP	appointments/resources, Projects SIJCEMP/GetEmployees

This domain is fully mapped and implemented (push + 5-minute poll-back).

5. What Works vs What's Missing

Available now via published APIs:

- Customer/contact migration + incremental sync (Sage Core GetCustomers + Sicon CRM).
- Suppliers, stock catalogue, sales orders, invoices/ledgers (Sage Core) — if needed.
- Service case create + status/appointment/notes sync (Service API) — already live.
- Contract creation/push into Sicon (Contracts API).
- Authentication / multi-company connection.

Missing / blocked:

- Equipment register read/list API (installed serial-numbered assets) — critical, 300k records.
- Contracts read/list API — cannot pull existing contracts or read them back for sync.
- Equipment <-> contract / site linkage read — needed to know which assets a contract covers.

6. Questions for Sicon (what we need to proceed)

Equipment (highest priority):

- Q1. Is there an API to list/search the installed Equipment / Service Asset register for a company — ideally paged and with a 'changed since' filter for incremental sync?
- Q2. If not a dedicated endpoint, can Equipment be read via the Service API generic GET /~/api/v2/TEntity paged reader? If so, what is the entity type/identifier for Equipment and what fields are returned?
- Q3. If no API path exists, can you provide a one-time SQL/DB or CSV export of all equipment per company (SiconEquipmentID, serial, make/model/type, install date, warranty/contract cover, linked customer SLCustomerAccountID and site/sub-location)? We have an importer ready to ingest it.

Contracts:

- Q4. Is there (or planned) a GET/list endpoint for Service Contracts and contract lines so we can migrate existing contracts and read contract state back? If not, can you provide a CSV/DB export?

Equipment <-> coverage:

- Q5. How is the link between an equipment asset, its site/sub-location, and its covering contract exposed for reading?

Operational:

- Q6. Recommended rate limits / page sizes for bulk reads at our scale (5k customers / 300k assets)?
- Q7. Any webhooks / change-notification mechanism, or is scheduled polling (AmendedAfterDate / updated-since) the expected pattern?
- Q8. Confirm the production base URL pattern per customer instance and any IP allow-listing needs.

7. Proposed Plan

Phase	Scope	Dependency
1 (in progress)	CSV importers for equipment + contracts (idempotent, batched); capture SiconEquipmentID / SiconContractID	None — live
2	Automated customer pull + incremental sync (Sage Core GetCustomers / CRM)	None — ready to build
3	Automated equipment migration + sync	Q1-Q3 (Sicon)
4	Contract migration + two-way read	Q4 (Sicon)

Contact: the Pulse Fitness AI integration team. We are happy to join a technical call to walk through any of the above.
